

Ceramic – LED Scanner

The Ceramic Scanner has been developed to meet special requirements of the ceramic industry

Its magnetic copy board can carry objects with a weight of up to 150 kg. A light correction program allows to scan originals of different thickness.

The LED Light System, together with the Professional ICC Profiles, guarantees the best scanning results with the most color fidelity you can get. Even more, using special light modes, like texture effect or light angle device, you will capture the surface of the objects in astonishingly naturalness.

The fixed scan resolution for a maximum scan size of 84 x 120 cm is 600 dpi. Using Image Stacking software you can generate fascinating results by mixing images, captured in different modes.
